with a modified polylinker: plasmid DNA from the
normalized library NCI_CGAP_PT22 was prepared, and ss
circles were made in vitro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from a pool
of 5,000 clones made from the same library (cloneIDS
985608-986759, 1101192-1101959, and 1217228-1220615).
Subtraction by Bento Soares and M. Fatima Bonaldo. "

It was incorporated into an appropriate vector to transform Saccharomyces cerevisiae or E.coli. Monomeric TGF-beta1 was purified, denatured and dissolved in 140ml 50mM Tris/HCl pH8. IM NaCl. 5mM EDTA, 2mM reduced glutathione, 1mM oxidised glutathione and 33mM Chaps. After 72 hrs at 4 deg C, pH was adjusted to 2.5 and the mixture was conc. 10 times. The conc. soln was diluted to the original vol. with 10mM HCl and conc to a final vol of 10 ml. The supernatant from centrifugation at 5000g for 30 min contained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           β

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-betal, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness inclaional wounds and increase formation of fibrous granular tissue. See e.g. AAQ41602-Q41607 for pref. hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 ALDINYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTIHST 60

growth factor (TGF) beta-1, TGF beta-2 and TGF beta-3 which are used to growth factor (TGF) beta-1, TGF beta-2 and TGF beta-3 which are used to produce TGF beta-1ike proteins in dimeric form. THE TGF beta-like proteins in dimeric form. THE TGF beta-1ike proteins are in protein proteins of TGF beta-2.3, etc, or bone morphogenic proteins e.g. BMP-2. The TGF beta hybrids were made using a new process of producing dimeric, biologically active TGF beta monomers with folding buffer contg. a mild detergent (CHAPS, CHAPSO or digitionin) and at least one of the columning dimerity sulphoxide). DMSOZ (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological crivity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins in their native dimeric form. TGF-beta like proteins are multifunctional regulators of cellular activity and a typical use is to stimulate wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acid-stable; heat-stable; homodimer; mitogenesis; cell proliferation; cell growth; wound; oral mucositis; intestinal mucositis; osteoarthritis; bone disease; bone repair; therapy.

TGF-beta3 is one of five distinct homodimeric TGFbeta4. TGF-beta3 is one of five distinct homodimeric homodimer. All the TGF-beta s are produced as 390-412 amino acid precursors, which undergo proteolytic cleavage to produce mature forms which consist of the C-terminal 112 amino acids. Depending upon cell and tissue type, and the presence of other growth factors, TGF-beta may either stimulate mitogenesis, cell proliferation and growth, or inhibit these processes. Many of the actions of TGF-beta are related to the resultant damage. A crystalline form of TGF-beta3 can be produced by a method of the invention. Crystalline TGF-beta3 is useful in slow release
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          compositions for treatment of conditions such as wounds, oral or
intestinal mucositis, osteoarthritis, bone disease and repair, generally
wherever TGF-beta1 is normally used. The crystalline form is also used
for structure determination in rational drug design. Crystalline
TGF-beta3 shows lower tendency than the dissolved protein to adsorb on
the walls of vials and is more stable against oxidation. Variation of the
properties, e.g. size, of the crystals allows control over the rate at
which active TGF is released in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. The present sequence represents a specifically claimed TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site:ECM binding site:proteinase site:TGF-beta. TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta which may result in undesirable effects.
                                                                                                                                                                                                                                                                                         Prepn. of transforming growth factor-beta fusion protein - useful to reduce surgery recovery time and to prepare artificial skin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                             This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). AAY08278-Y08301 are human growth factor protein fragments used in the method of the invention.
                                                                                                                                                                                                                                                                                     Gaps

The present sequence represents the mature form of transforming growth factor-beta-3. Dimeric, biologically active TGF-beta-like protein can be produced by subjecting the denatured monomeric form to refolding conditions. The new monomeric S-sulphonated TGF-beta-like protein is useful for the production of the dimeric, biologically active TGF-beta-like protein, which is useful for the treatment of wounds (surface or internal) and cancer in a mammal, in bone and tissue repair, as a bone marrow protective agent, a mediator of cardioprotection, for the production of an anti-inflammatory or immunosuppressive preparation. Treatment is useful for animals, especially humans, and wound treatment (e.g. ulcers, bed sores etc.) is particularly useful for the elderly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Proteinase site; bone morphogenetic fusion protein; bone binding site; bone morphogenetic protein; transforming growth factor beta; active fragment; wound healing; bone growth; purification tag.

                                                                                                                                                                                                                                                 ô
                                                      The present sequence represents a transforming growth factor beta active fragment. The protein can be used in place of a bone morphogenetic active fragment to create the fusion proteins of the invention. When a bone morphogenetic active fragment is used, the fusion proteins are designated bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic purification tag, a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment.

Mutants comprise at least one electrostatic charge altering mutation in a beta hairphin loop, resulting in increased bloactivity.

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFs, are claimed. The CKGF approperties, compared to wild type CKGFs, are claimed. The CKGF is superfamily comprises at least four families of growth factors the glycoprotein hormones, the platelet-darived growth factor (PDGF) family, the neurotrophins and the transforming growth factor-beta family; the families are known to be structurally similar (especially comprising the cystines know topology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             analogues are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mutant transforming growth factor family proteins or analogues are useful for treatment of ovulatory dysfunction, luteal phase defect, unexplained infertility, time-limited conception and in assisted reproduction.
                                                                                                                                                                                                                                               growth factor proteins comprising one or more for treating or preventing diseases e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                          providing attachment of a hearin binding peptide (HBP), a peptide comprising a binding domain which binds heparin with high affinity, heparin or heparin-like polymer, and a protein growth factor or peptide fragment which has a domain that binds heparin with low affinity.

Included in the invention is a vascular graft comprising the matrix, which is capable of supporting cell adhesion. The matrix is used for peptides in a controlled manner suitable for wound healing. The matrix or an be used in an article for treating dermal wounds, and in an implantable sterilized composition capable of supporting cell adhesion. The present sequence represents a growth factor protein: The present sequence represents a growth factor protein. The protein is used in an example illustrating that non-heparin-binding growth factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                            can be released in a controlled manner from heparin-based drug delivery systems based on their low affinity for heparin.
                                                                                                   Matrix for controlled release of growth factor for wound healing, has substrate that attaches heparin binding peptide, protein growth factor that bind heparin with low affinity, and heparin or heparin-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gene therapy; growth differentiation factor-8; GDF-8; AIDS; cachexia; neurodegenerative disease; amyotrophic lateral sclerosis; obesity; muscular dystrophy; musculodegenerative disease; tissue repair; muscle wasting disease; neuromuscular disorder; spinal cord injury; traumatic injury; congestive obstructive pulmonary disease.

                                                                                                                                                                                                                                                   The present invention relates to growth differentiation factor-8 (GDF-8) coding sequences and proteins. The present sequence is a protein, which was used in a sequence homology comparison with the GDF-8 protein isolated in the present invention. GPF-8 is useful for treating neurodegenerative diseases (e.g. amyotrophic lateral sclerosis and muscular dystrophy), musculodegenerative diseases or in tissue repair due to trauma, obesity and disorders related to abnormal proliferation of adipocytes. GPF-8 is also useful for treating malignancies of the various organ systems, particularly cells in muscle or adipose tissues and in gene therapy for the treatment of cell proliferative or immunological diseases mediated by GDF-8. In addition, GDF-8 is also useful for treating muscle wasting disease, neuromuscular disorder, spinal cord injury, traumatic injury, congestive obstructive pulmonary disease
New substantially purified growth differentiation factor-8 polypeptide,
                               useful for treating muscle wasting disease, obesity, muscular dystrophy, neuromuscular disorder, acquired immunodeficiency syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                            Gene product may be used to inhibit growth of tumour cells, to treat proliferative type disorders, burns and other wounds, and may also be used as an immune modulator. Detection of proteins and of TGF-alpha can indicate presence of a tumour. Proteins may be produced from a bacterial or eukaryotic expression
Tissue-derived tumour growth inhibitors - used in diagnosis and treatment of tumours and treatment of proliferative type disorders, burns and wounds
                                                                                                                                           ;

This sequence represents human transforming growth factor-beta 3 (TGF-beta 1. This sequence and the sequence for human TGF-beta 1 (see AAR73596) are claimed within the scope of the invention. The invention is a composition consisting of a TGF-beta protein and an osteogenic color source (OCS) formulated in an acceptable carrier other than a bone morphogenic cofactor. This composition can be used for the restoration of bone deficiency. This provides for the generation of mature bone only where it is required, without the inclusion of a specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Transforming growth factor-beta; Human TGF-beta protein; TGF-beta 1; TGF-beta 3; osteogenic cell source; OCS; bone deficiency; bone-inducing cofactor.
The TGF-beta3 gene sequence was obtained from three shorter overlapping clones derived from human placental, human umbilical cord and A673 cells cDNA libraries, respectively. The predicted amino acid sequence of the gene encoding TGF-beta3 shows extensive homology to TGF-beta1 and beta2. Based on the functional and structural homology, it is likely that TGF-beta3 has therapeutic activity in cancer therapy, wound healing and immunosuppression. See also AAQ22229 and AAR20622.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ø

The specification describes a composition for regulating trophoblast invasion which comprises an inhibitor of TGF-beta3, TGF-beta family cytokine receptors, hypoxia inducible factor 1 alpha (HIF-1 alpha) or oxygen tension. The composition is used in methods of diagnosing, monitoring, preventing or treating conditions requiring regulation of trophoblast invasion, especially preeclempsia in pregnant

```
This is the amino acid sequence of human transforming growth factor beta-3 (TGF-beta 3, see also AAW7878). The sequence shows homology to human TGF-beta 1 (see AAW78781), porcine TGF-beta 3 (see AAW7878) and bovine TGF-beta 2 (see AAW78784) N-terminal sequences. The invention relates to the recombinant production of TGF-beta. DNA encoding TGF-beta has been isolated and cloned into vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from transformed cells can be used in known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 ALDTNYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

growth factor-beta 3 precursor (preTGF-beta 3), deduced from an isolated CDNA clone (see AAV52935). The invention relates to the recombinant production of TGF-beta. Biologically active TGF-beta is defined as being capable of inducing EGF-potentiated anchorage independent growth of target cell lines and/or growth inhibition of neoplastic cell lines. Nucleic acids encoding TGF-beta have been isolated and cloned into vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from transformed cells is used in known therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding transforming growth factor-beta precursor sequence useful for analysis to perform manipulations to increase yield of recombinant production of the protein

A genomic fragment corresponding to a human TGF-beta-1 exon (AAQS6924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the construction of vectors for the expression of recombinant TGF-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                             Nucleotide sequence encoding transforming growth factor beta-3 used as a probe, or to produce TGF beta 3, for inhibiting growth of certain normal and neoplastic cells, eg A549.
                                                                                                                                                                                                                             This sequence represents porcine transforming growth factor-beta 3 (TGF-beta 3) polypeptide. The corresponding nucleic acid sequence of this subtype is useful as a probe or to produce this protein for normal and neoplastic cell growth inhibition. It differs from human TGF-beta 3 at several AA positions.
                                                                                                                                                                                                                                                                                                                                                     Gaps
                        Transforming growth factor beta-3 (TGF beta 3); tumour cells; growth inhibition.
                                                                                                                                                                                                                                                                                                                                             1 ALDTNYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

The Fractor Xa cleavage site may be replaced by a similar protease recognition site, e.g. for collagenase. The mutant protein may also include a hydrophobic transmembrane amino acid sequence, e.g. from c-erbB2 and a "stop transfer" sequence. The protease recognition site is located between the C-terminal of the transmembrane region (when present) and the herminal of the TGF-beta 3 precursor. Mature TGF-beta 3 can then be efficiently cleaved from the membrane. See also AAQ20576 and AAR20622.

                                                                                                                                                              This sequence is that of porcine transforming growth factor-beta 3 (TGF-beta 3) polypeptide. It differs from human TGF-beta 1 sequence at positions 9-11,13,19,40,45,52,55,66,66,60,63,76,68,71,75,82,87,95 and 96. Nucleic acid sequence encoding subtype 3 of TGF-beta (TGF-beta 3) is useful as a probe or to produce TGF-beta 3 for both normal and neoplastic cell growth inhibition.
                                                                                                           Nucleotide sequence encoding transforming growth factor beta-3 used as a probe, or to produce TGF beta 3, for inhibiting growth of certain normal and neoplastic cells, eg A549.

beta-3 (TGF-beta 3, see also AAW78786). The sequence shows homology to human TGF-beta 3 (see AAW78781), human TGF-beta 3 (see AAW78781), human TGF-beta 3 (see AAW78781) invention TGF-beta 2 (see AAW78784) N-terminal sequences. The invention relates to the recombinant production of TGF-beta. DNA encoding TGF-beta has been isolated and cloned into vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from transformed cells can be used in known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

pig TGF-beta-3 (AAQ56925) and human TGF-beta-3 (AAQ56926), and the corresponding amino acid sequences were determined (AAR46227-29, respectively). A genomic fragment corresponding to a human TGF-beta-1 exon (AAQ56924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the construction of vectors for the expression of recombinant TGF-

```
Tissue-derived growth inhibitor and corresponding genes - useful for detection of tumours, inhibition of tumour growth, treatment of proliferative disorders and healing of burns and wounds.
                                                                                       öf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence represents mature tumor growth inhibitor (TGI), which is produced by recombinant DNA methods. TGI can be used to inhibit the growth of human tumour cells, e.g. carcinoma, melanoma or leukaemia cells, in the treatment of proliferative disorders
         This is the amino acid sequence of the porcine transforming growth factor-beta 3 precursor (preTGF-beta 3), deduced from isolated CDNA sequences (see AAV52934). The invention relates to the recombinant production of TGF-beta. Biologically active TGF-beta is defined as being capable of inducing EGF-potentiated anchorage independent growth of target cell lines and/or growth inhibition oneoplastic cell lines. Nucleic acids encoding TGF-beta have been isolated and cloned into vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from transformed cells is used in known therapeutic applications.

However, amino acids 54-93 of the TGI precursor are not provided in the specification. TGI, or its 205 amino acid precursor, can be used to inhibit the growth of human tumour cells, e.g. carcinoma, melanoma or leukaemia cells, in the treatment of proliferative disorders e.g. arteriosclerosis, inflammation and psorliferative disorders e.g. arteriosclerosis, inflammation and healing. The proteins can also be used as immunomodulators. Although the proteins can also be used as immunomodulators. Although the proteins disorder growth inhibitory activity, they are not transforming growth factor-beta-1 or -beta-2. The 20-amino acid peptide CM-1 (as featured) inhibits the growth of human tumour cells but not of a mink lung cell line.

tumour growth, treatment of
of burns and wounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    residues 54-93 of the precursor protein are not specified "
e.g. arteriosclerosis, inflammation and psoriasis, or for the treatment of burns to facilitate wound healing. TGI can also be used as an immunomodulator. Although the protein has tumour around inhibitory activity, it is not transforming growth factor-beta-1 or -beta-2. The peptide CM-1 (as featured) inhibits the growth of human tumour cells but not of a mink lung cell line.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents the precursor of tumor growth inhibitor (TGI) (see AAR86770), which is produced by recombinant DNA methods.

It differs from mature human TGF-beta subtype 1 AA sequence at positions 9-11,13,19,40,45,52,57,58,60,63,67,68,71,75,82,87,and 95. The nucleic acid sequence encoding subtype 3 of TGF-beta is useful as a probe or to produce TGF-beta 3 for both normal and neoplastic cell growth inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleotide sequence encoding transforming growth factor beta-3 used as a probe, or to produce TGF beta 3, for inhibiting growth of certain normal and neoplastic cells, eg A549.
                                                                                                                                                                                                                                                                                                                                                                                              A plasmid carrying DNA encoding the TGI was isolated from a human cDNA library prepd. from the DNA of a chronic myelocytic leukaemia cell line (K562). The sequence can be used to produce the TGI by recombinant techniques. The protein may also be isolated from human umbilical cord and placental tissues. It can be used to inhibit tumour cell growth, to treat burns, to facilitate the healing of wounds or to treat proliferative disorders. The protein and Abs raised to it can be used for detection and typing of tumours. The Abs can also be used to inhibit the activity of the TGI.
                                                                                                                                                                                                                                                                                                                                                  Gaps

The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta1(44/45)beta3. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.

It was produced by E. coli LC37 transformants carrying plasmid ppLMu.TGF-beta1(44/45)beta 3, which includes a coding sequence (AAT17237) for the hybrid. A bologically active, dimeric form of TGF-beta1-3 was obtd. by refolding the monomer in detergent-free buffer contg. DMSO and/or DMF. Hybrid dimers TGF-beta 2-3 (AAR92776) and TGF-beta 3-2 (AAR92777) were

AAR91959 is transforming growth factor (TGF) beta-like protein, TGF-beta-1-3. TGF beta-1-3 is a hybrid of TGF-1 and TGF-3. TGF beta bybrids were made using a new process of producing dimeric, biologically active TGF beta-like proteins. The new process involves treating denatured TGF beta-like proteins. The new process involves treating denatured TGF beta-like proteins. The new process involves treating denatured TGF beta-like proteins at least one of the solvents DMSO (dimethyl sulphoxide), DMSOS (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins are multifunctional by allows the protein activity and a typical use is to stimulate wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 112;

The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta2(44/45)beta3. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

AAR91960 is transforming growth factor (TGF) beta-like protein, TGF-beta-2-3. TGF beta-2-3 is a hybrid of TGF-2 and TGF-3. TGF beta bybrids were made using a new process of producing dimeric, biologically active TGF beta-like proteins. The new process involves treating denatured TGF beta-like proteins. The new process involves treating denatured TGF beta-like proteins. The new process involves treating denatured TGF beta-like protein a least one of the solvents DMSO (dimethyl sulphoxida), DMSO2 (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins are multifunctional regulators of cellular activity and a typical use is to stimulate wound

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41509, AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta3(44/45)beta2. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 ALDITNYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A recombinant, non-soluble, monomeric hybrid of human transforming growth factor-beta, TGF-beta 2-3 (AAR92776), is composed of the N-terminal portion of TGF-beta 2 (see also AAR92774) and the C-terminal portion of TGF-beta 3 (see also AAR92772). It was produced by E. coli LC37 transformants carrying plasmid pPLMu.TGF-beta2(44/45)beta3, which includes a coding sequence (AAT17238) for the hybrid. A biologically active, dimeric form of TGF-beta2-3 was obtd. by refolding the monomer in detergent-free buffer contg. DMSO and/or DMF. Hybrid the manamer is detergent-free buffer contg. DMSO and/or DMF. Hybrid dimers TGF-beta 1-3 (AAR92775) and TGF-beta 3-2 (AAR92777) were

```
AAR91961 is transforming growth factor (TGF) beta-like protein, TGF-beta-3-2. TGF beta-3-2 is a hybrid of TGF-3 and TGF-2. TGF beta hybrids were made using a new process of producing dimeric, blologically active TGF beta-like proteins. The new process involves treating denatured TGF beta monomers with folding buffer contg. a mild detergent (CHAPS, CHAPSO or digitonin) and at least one of the solvents DMSO (dimethyl sulphoxide), DMSO2 (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer buch that, after dimerisation, the TGF beta-like protein retains blological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form: TGF-beta like proteins are multifunctional requirators of cellular activity and a typical use is to stimulate wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Prodn. of dimeric, biologically active transforming growth factor
beta - by refolding denatured monomer in buffer contg. mild detergent and specific organic solvents to improve yields
                                                                                                                                                                                                                     method;

growth factor-beta, TGF-beta 3 (see also AAR92777), is composed of the N-terminal portion of TGF-beta 3 (see also AAR92777), is composed of the portion of TGF-beta 2 (see also AAR92774). It was produced by E. coli LC37 transformants carrying plasmid ppLMu-TGF-beta3/44/45) beta2, which includes a coding sequence (AAT17239) for the hybrid. A lologically active, dimeric form of TGF-beta3-z was oblid. By refolding the monomer in detergent-free buffer contg. DMSO and/or DMF. Hybrid dimers TGF-beta 1-3 (AAR92775) and TGF-beta 2-3 (AAR92776) were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 ALDINYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

```

```
The invention relates to a novel isolated and purified growth factor (GF) that comprises persephin or a fragment or a conservatively substituted variant. The persephin GF polypeptides can promote the survival and growth of neurons and non-neuronal cells. The persephin GF polypeptides or polynucleotides can be used for preventing or treating cellular degeneration or insufficiency, e.g. neuronal degeneration resulting from peripheral neuropathy, amyotrophic lateral sclerosis, Alsheimer's disease, Parkinson's disease, Huntington's disease, ischemic stroke, acute brain injury, acute spinal cord injury, nervous system tumours, acute brain injury, acute spinal cord injury, nervous system tumours, consulting from eosinopenia, anemias, thrombocytopenia, or stem cell insufficiences, cardiac muscle degeneration or insufficiency resulting from eosinopenia, anemias, thrombocytopenia, or stem cell insufficiences, cardiac muscle degeneration or insufficiency resulting from eosinopenia, anemias, thrombocytopenia, or stem cell insufficiences, cardiac muscle degeneration or insufficiency resulting from eosinopenia, and injury, exposure to be used for treating agents and damage caused by infectious agents. The GF can also be used for condition mediated by expression of persephin by a population of cells.

The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          15 CCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHSTVLGLYNTLNPEASA 74

The invention relates to mutant TGF-beta (transforming growth factorbeta) superfamily members. These mutants comprise one or more amino acid substitutions in the base region of the finger 2 subdomain, and a cretarinal residue selected from Arg, Ile, Ieu, Ser and Ala. In the finger 2 subdomain, basic residues (e.g., Glu, Ser, Iys), or residues containing an amide group (e.g., Gln, Asp), are substituted with acidic containing an amide group (e.g., Glu, Asp), are substituted with acidic residues (e.g., Thr). TGF-beta superfamily proteins containing a hydroxyl group (e.g., Ser, Thr). TGF-beta superfamily proteins regulate developmental content or proteins such as the osteogenic proteins (OPS), bone morphogenetic proteins such as the osteogenic proteins (OPS), compassed by the invention are the finger 2 subdomain mutants of human osteogenic protein- (OP-1) (AAB09576-B09615). Mutant TGF-beta proteins care used for inducing tissue morphogenesis in bon- non-mineralised skeletal tissue, dental tissue, connective tissue, brain, liver and nerve consective dental tissue, connective tissue, brain, liver and nerve connective tissue can be used in conjunction with a biocompatible matrix e.g., collagen, hydroxyapatite or carboxymethylcellulose for regenerating bone, cartilage and/or other mineralised skeletal or regenerating band intervertebral discs. The OP-1 mutants can be used to repair capsule and intervertebral discs. The OP-1 mutants can be used to repair connective fissues e.g., ligament, tendon, muscle, fibrocartilage, discassed or damaged mammalian tissue mediated tissue damaged mammalian tissue end to prevent or substantially file to reponse mediated tissue damaged and and substantially filesues e.g., ligament endon to prevent or substantially filesues e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tissue formation following an injury. Compared to the wild-type TGF-beta superfamily members, the mutant proteins have improved in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transforming growth factor-beta superfamily member mutant induces tissue morphogenesis in e.g. bone, non-mineralized skeletal tissue, dental tissue and connective tissue and comprises a substitution in a region of the finger 2 domain -
TGF-beta superfamily; transforming growth factor-beta; developmental regulation; finger 2 subdomain; basic region; protein refolding; stability; solubility; osteogenic protein; OP; bone morphogenetic protein; BMP; growth/differentiation factor; GDF; inhibin; tissue morphogenesis; regeneration; bone; dental tissue; connective tissue; cartilage; vulnerary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                refolding properties in a pH range of 6-9, increased solubility in aqueous solution and improved stability and/or activity. Sequences AAB09519-B09542 and AAB09553-B0958 represent a variety of wild-type TGF-beta superfamily proteins referred to in the specification.

The present invention describes a tumour growth factor beta (TGF-beta)

Superfamily chimeric protein (I) derived from at least 2 different

members of the superfamily comprising a dimer with one monomer that

contains a finger 2 domain derived from a first family member and a

finger 1 domain and heel domain, both derived from a second family

member. The monomer further comprises a conserved c-terminal cysteine

skeleton. (I) has osteogenic, proliferative and antiinflammatory

cutivities. The TGF-beta superfamily chimeric proteins (I) are useful

cotivities. The TGF-beta superfamily chimeric proteins (I) are useful

crimicalised skeletal tissue, dental tissue, connective tissue,

non-mineralised skeletal tissue, dental tissue, connective tissue,

brain, liver and nerve and for inducing the proliferation and

differentiation of uncommitted progenitor cells in a tissue-specific

manner to support new tissue formation. AAA29807 and AAB02748

to AAB02824 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel TGF-beta superfamily mutant chimeric protein, useful for inducing tissue morphogenesis in e.g. bone, comprises a dimer consisting of one monomer containing domains from two family members
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Superfamily members. These sequences can be used to form novel fusion superfamily members. These sequences can be used to form novel fusion proteins. Owner proteins copmrise biologically active TGF-beta family member fusion proteins competent to refold under suitable refolding conditions. The fusion proteins comprise; (1) a TGF-beta family protein conditions. The fusion proteins comprising finger 1, finger 2 and heel subdomains; and (2) a heterologus leader sequence domain operatively linked to the C-terminal domain. Truncations, heterodimers and mutants of these fusion proteins and methods of purifying the heterodimers are also claimed. The TGF-beta family proteins can be used to induce the full cascade of morphogenic events which culminate in skeletal tissue full cascade of morphogenic events which culminate in skeletal tissue seful in the binding cartilage and endochoronal bone formation. They are useful in the binding of fibrin and fibronectin to the implanted matrix, chemotaxis of cells, proliferation of fibricals invasion, bone formation into chondroblasts, cartilage formation, vascular invasion, bone formation in remodeling, and bone marrow differentiation. The proteins have improved physical properties such as solubility and stability, improved target in caractivity, including altered receptor binding and improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A biologically active TGF-beta family member fusion protein competent to refold, comprising a C-terminal linked TGF-beta family protein

```
The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ4159), AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids formed using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta1(44/45)beta2. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 ALDINYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTIHST

A substantially pure polypeptide composition having AA sequence given in AAP80462 is claimed. Also claimed is a polypeptide comprising AA sequence of at least eight AAS included in the sequence in AAP80462. The eight polypeptide (designated TGF-beta2) may be used in the treatment of hormonally responsive carcinomas. The TGF-beta2 and fragments can also be used in diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 ALDTNYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ1599, AAQ41600, and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta3 (44/45)beta1. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and full-takes formation of fibrous granular tissue. See AAQ41602-Q41607 for the most pref. hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 ALDINYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue. See e.g. AAQ41602-Q41607 for pref. hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cardioprotective, antiinflammatory and immunosuppressive agents etc

                                                                                                                                                                                                                                                                                                                                                                                                        The TGF-beta2 coding sequence was isolated from the CI-215 human glioma cell line. It was incorporated into an appropriate vector to transform Saccharomyces cerevisale or E.coli. Monomeric TGF-beta1 was purified, denatured and dissolved in 140ml 50mM Tris/HCl pH8. IM NaCl. 5mM EDTA. 2mM reduced glutathione, ImM oxidised glutathione and 33mM Chaps. After 72 hrs at 4 deg C, pH was adjusted to 2.5 and the mixture was conc. 10 times. The conc. soln was diluted to the original vol. with 10mM HCl and conc to a final vol of 10 ml. The supernatant from centrifugation at 5000g for 30 min contained disulphide-linked dimeric TGF-beta2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 ALDINYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHŚT 60
